

Selected Properties of Efavirenz

| | |
|---|--|
| Other names | Sustiva® (North America), Stocrin® (Europe), DMP-266 Combination formulations: <ul style="list-style-type: none"> • Atripla®: efavirenz/emtricitabine/tenofovir |
| Manufacturer | Bristol-Myers Squibb Canada |
| Pharmacology/Mechanism of Action | Non-competitive, selective binding to reverse transcriptase enzyme causing conformational change that inactivates the catalytic site, preventing proviral DNA synthesis in HIV-1. Does not require intracellular phosphorylation. |
| Activity | IC ₉₀₋₉₅ : 1.7 - ≤25 nM (wild-type) |
| Resistance - genotypic | Mutations in the reverse transcriptase gene associated with resistance to reverse transcriptase inhibitors (IAS-USA Fall 2005 Resistance Mutations) <i>L100I[#], K103N[*], V106M[*], V108I, Y181C/I[#], Y188L[*], G190S/A[#], P225H</i> *multi-NNRTI resistance <i>[#]accumulation of ≥2 leads to multi-NNRTI resistance</i> |
| Resistance - phenotypic | Phenotypic data on clinical virus isolates associated with various mutations using ViroLogic PhenoSense™ (http://hivdb.stanford.edu/) K103N: 19-fold ↑ (high resistance) V106A: 1.9-fold ↑ (low resistance) Y188L: 130-fold ↑ (high resistance) G190A: 7-fold ↑ (intermediate resistance) G190S: 52-fold ↑ (high resistance) Multiple mutations confer high-level resistance (100-200 fold) to efavirenz: L100I + K103N: 274-fold ↑ (high resistance) G190A + K103N: 213-fold ↑ (high resistance) K103N + P225H: 100-fold ↑ (high resistance) K103N + Y188L: 270-fold ↑ (high resistance) |
| Cross-Resistance | K103N mutation confers high-level resistance to other NNRTIs. In vitro, efavirenz retains activity against variants containing V106A, Y181C, Y188C, G190A, and P236L mutations (all reported with other NNRTI therapies). Cross-resistance between efavirenz and protease inhibitors or nucleoside analogues unlikely because enzyme targets are different. |
| Oral Bioavailability | |
| Effect of Food | Can take with or without food. High fat meal (670 kcal, 60% fat, 400 kcal fat) may ↑ EFV concentrations by 50%. |
| Protein Binding | 99.75% (albumin) |

| | |
|--|---|
| Vd | |
| Tmax | 3 - 5 hours |
| serum T ½ | 40-55 hours after multiple doses |
| Drug Concentrations | Dose-related increases in Cmax and AUC seen for doses up to 1600 mg; may have diminished absorption at higher doses. In 35 patients receiving efavirenz 600 mg once daily, steady-state Cmax was 12.9 ± 3.7 µM (mean ± SD), steady state Cmin was 5.6 ± 3.2 µM, and AUC was 184 ± 73 µM•h. |
| Minimum target trough concentrations (for wildtype virus) | Cmin: >1000 ng/mL Cmax: <4000 ng/mL |
| CSF (% of serum) | <p>In HIV-1 infected patients (n=9) who received efavirenz 200-600 mg once daily for at least one month, cerebrospinal fluid concentrations ranged from 0.26 to 1.19% (mean 0.69%) of the corresponding plasma concentration. This proportion is approximately 3-fold higher than the non-protein-bound (free) fraction of efavirenz in plasma.</p> <p>2010 CNS Penetration Effectiveness (CPE) Score: 3 [Letendre S et al. 2010]</p> <p>Paired CSF and plasma samples were obtained from patients taking standard doses of efavirenz. Efavirenz concentrations were 0.5% of plasma concentrations. Efavirenz CSF concentrations:IC50wt (0.51 ng/mL) ratio was 26 (IQR 8-41). Two CSF concentrations (2.6%) were below the IC50.[Best B et al. CROI 2009]</p> <p>In a patient with cryptococcal meningitis, plasma and CSF efavirenz concentrations were measured over 24 hours. The median plasma efavirenz concentration was 3,718 ng/ml (range, 2,439 to 4,952), and the median CSF concentration was 16.3 ng/ml (range, 7.3 to 22.3). The CSF/plasma area-under-the-curve ratio was 0.0044 corresponding to a CSF penetration of 0.44% of plasma.[Yilmaz et al. 2012]</p> |
| Metabolism | Metabolism primarily via CYP 3A4, and 2B6; undergoes autoinduction (20-40%) during first two weeks of therapy; major metabolite (inactive): glucuronide conjugate |
| Excretion | 14-34% (primarily hydroxylated metabolites) excreted in urine, 16-61% in feces. |
| Dosing – Adult | <p>600 mg once daily preferably before bedtime. Can take with food, however high fat foods may increase the absorption by 50%, thus potentially increasing side effects.</p> <p>NB: Efavirenz is contraindicated in pregnancy; women of childbearing potential should undergo pregnancy testing before initiation of efavirenz.</p> |

| <p>Dosing – Pediatric</p> | <p>Infants/children (at least 3 months of age and weighing between 3.5-40 kg):</p> <table border="1" data-bbox="673 283 1425 619"> <thead> <tr> <th>Patient Body Weight</th> <th>SUSTIVA Daily Dose</th> <th>Number of Capsules^a or Tablets^b and Strength to Administer</th> </tr> </thead> <tbody> <tr> <td>3.5 kg to less than 5 kg</td> <td>100 mg</td> <td>two 50 mg capsules</td> </tr> <tr> <td>5 kg to less than 7.5 kg</td> <td>150 mg</td> <td>three 50 mg capsules</td> </tr> <tr> <td>7.5 kg to less than 15 kg</td> <td>200 mg</td> <td>one 200 mg capsule</td> </tr> <tr> <td>15 kg to less than 20 kg</td> <td>250 mg</td> <td>one 200 mg + one 50 mg capsule</td> </tr> <tr> <td>20 kg to less than 25 kg</td> <td>300 mg</td> <td>one 200 mg + two 50 mg capsules</td> </tr> <tr> <td>25 kg to less than 32.5 kg</td> <td>350 mg</td> <td>one 200 mg + three 50 mg capsules</td> </tr> <tr> <td>32.5 kg to less than 40 kg</td> <td>400 mg</td> <td>two 200 mg capsules</td> </tr> <tr> <td>at least 40 kg</td> <td>600 mg</td> <td>one 600 mg tablet OR three 200 mg capsules</td> </tr> </tbody> </table> <p>^aCapsules can be administered intact or as sprinkles</p> <p>^bTablets must not be crushed</p> | Patient Body Weight | SUSTIVA Daily Dose | Number of Capsules ^a or Tablets ^b and Strength to Administer | 3.5 kg to less than 5 kg | 100 mg | two 50 mg capsules | 5 kg to less than 7.5 kg | 150 mg | three 50 mg capsules | 7.5 kg to less than 15 kg | 200 mg | one 200 mg capsule | 15 kg to less than 20 kg | 250 mg | one 200 mg + one 50 mg capsule | 20 kg to less than 25 kg | 300 mg | one 200 mg + two 50 mg capsules | 25 kg to less than 32.5 kg | 350 mg | one 200 mg + three 50 mg capsules | 32.5 kg to less than 40 kg | 400 mg | two 200 mg capsules | at least 40 kg | 600 mg | one 600 mg tablet OR three 200 mg capsules |

| 32.5 kg to less than 40 kg | 400 mg | two 200 mg capsules | | | | | | | | | | | | | | | | | | | | | | | | | | |
| at least 40 kg | 600 mg | one 600 mg tablet OR three 200 mg capsules | | | | | | | | | | | | | | | | | | | | | | | | | | |
| <p>Special instructions for pediatric patients</p> | <p>Give at bedtime during first 2-4 weeks of therapy to decrease CNS effects</p> <p>Flavoured pediatric suspension available via expanded access (1-877-372-7097).</p> <p>Can open capsules and mix powder with two teaspoons of one of four possible food vehicles: applesauce, grape jelly, yogurt, or infant formula (but may result in hot “jalapeno” sensation) [Kaul et al. AJHP 2010;67:217-22].</p> <ol style="list-style-type: none"> 1. Hold the capsule vertically with the cap facing up. 2. Pull the cap away from the body of the capsule carefully, sprinkle and mix the contents with the food in a 100-mL container. 3. Administer the mixture with a spoon as soon as possible but no more than 30 minutes after mixing. 4. After administration of the efavirenz–food mixture, an additional small amount (approximately 2 teaspoons) of food or formula must be added to the empty mixing container, stirred to disperse any remaining efavirenz residue, and administered to the patient. <p>For nasogastric administration, may open capsules and mix with either 5 mL MCT oil or 15 mL Ora-Sweet (grind powder first to enhance dissolution). Powder is insoluble in water; do NOT mix with polyethylene glycol (will ↓ bioavailability).</p> <p>Efavirenz tablets may be crushed (personal communication, Bristol Myers Squibb Medical Information, March 5, 2009).</p> <p>Crushing Atripla® tablets: Bioequivalence of Atripla tablet and compounded oral liquid formulation in HIV-negative volunteers was not demonstrated. The 90% CI for FTC C_{max} and AUC fell within the range of 0.8-1.25 thus, bioequivalence was met, but the 90% CI for efavirenz C_{max} fell below the range of</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| | |
|---|---|
| | <p>bioequivalence while efavirenz AUC[∞] fell slightly above the range and tenofovir C_{max} and AUC[∞] fell above the range. Tenofovir C_{max} and AUC[∞] were approximately 40% and 20% higher, respectively with the liquid formulation. The clinical implications of these data are unknown.[King et al. JAIDS 2011;56(5):e131-2].</p> |
| Adjust in Liver Dysfunction | <p>Efavirenz and Atripla® are not recommended in patients with moderate or severe hepatic impairment (Child-Pugh Class B or C) because of insufficient data. Caution should be exercised in administering efavirenz or Atripla® to patients with mild hepatic impairment because of the extensive cytochrome P450-mediated metabolism of efavirenz and limited clinical experience.</p> <p>Limited data available. In 10 volunteers with chronic liver disease, efavirenz C_{max} was significantly lower compared to healthy volunteers (3.72 +/- 1.22 uM vs. 5.74 +/- 1.14 uM, respectively) while half-life was longer (152 +/- 41 h vs. 118 +/- 46 h, respectively). There were no significant differences in efavirenz AUC between the two groups (299 +/- 109 uM.h and 305 +/- 124 uM.h in the chronic liver disease and healthy volunteer subjects, respectively).(Fiske et al. CROI 99, #367).</p> <p>A case report documents elevated efavirenz and nelfinavir concentrations in 2 subjects with hepatic impairment, compared to controls (Maserati et al. 1999). Use with caution in patients with impaired hepatic function. Dosage adjustment may be required.</p> <p>In a case control study, HIV-positive subjects with hepatitis B or C coinfection and mild hepatic dysfunction (Child-Pugh score 5-6) did not experience significant differences in efavirenz levels over 2 years compared to a matched HIV-monoinfected control group.(Pereira et al. 2007)</p> |
| Adjust in Renal Failure/Dialysis | <p>Efavirenz: No adjustment necessary in end-stage renal disease.</p> <p>Atripla®: Because Atripla® is a fixed-dose combination, it should not be prescribed for patients requiring dosage adjustment such as those with moderate to severe renal impairment (creatinine clearance <50 mL/min).</p> <p>Hemodialysis: Hemodialysis does not affect pharmacokinetics of efavirenz. In a prospective study of HIV-infected patients on hemodialysis taking efavirenz 600 mg QD (n=13), 24-hour PK was assessed. Mean C_{min}, C_{max}, and AUC of EFV was 1.81 mg/mL, 5.04 mg/mL and 71.5 mg h/mL, respectively for efavirenz. The AUC geometric mean ratio (90% CI) was 132% (89, 197). Efavirenz may be administered regardless of hemodialysis schedule because of its extensive hepatic metabolism.[Gupta et al. 2008]</p> <p>CAPD: impact of CAPD on efavirenz removal seems to be minimal. No dosage adjustment required.</p> |
| Toxicity | Rash (26%): usually grade 1/2, can often treat through. Grade |

| | |
|---|---|
| | <p>3/4 rash (1%) . SJS (0.1%). Median time to onset 11 days, median duration 14 days. Mild rash treated symptomatically with antihistamines, analgesics/NSAIDs. Discontinue drug if severe rash or rash with constitutional symptoms (fever, blistering, oral lesions, conjunctivitis, swelling, muscle or joint aches, lymphadenopathy, increased LFTs or general malaise), and do not rechallenge. Avoid use of other NNRTIs with history of severe rash to efavirenz.</p> <p>CNS (52%): dizziness, impaired concentration, somnolence, abnormal dreams, insomnia, confusion, agitation, depersonalization, amnesia, hallucinations, euphoria. Symptoms usually resolve within a few weeks without interrupting therapy, and may be minimized by bedtime dosing (2.6% discontinuation rate). Worsening of underlying mental illnesses and increased suicidal ideation has been observed.</p> <p>Other: teratogenic in monkeys, increased AST/ALT, false-positive cannabinoid test, nausea, vomiting, diarrhea, headache</p> |
| <p>Pregnancy & Lactation</p> | <p>Pregnancy risk category D. Teratogenic effects (i.e. anencephaly, anophthalmia, cleft palate) seen in 3/20 (15%) of monkeys at efavirenz exposures similar to those seen in humans. There are 3 case reports of neural tube defects and 1 case of Dandy Walker Syndrome in humans with first trimester drug exposure. Use of efavirenz is contraindicated in the first trimester of pregnancy. Use after the 2nd trimester can be considered only if there are no other alternatives. Adequate contraception should be used post-partum and in all females of childbearing age. Women of childbearing potential should undergo pregnancy testing before initiation of efavirenz.</p> <p>NB: current treatment guidelines (DHHS, BHIVA) recommend avoiding use of efavirenz in pregnancy, but state that if a woman conceives while on efavirenz-based therapy and is virally suppressed, efavirenz may be continued. Check most current version of guidelines as information continues to evolve.</p> <p>Antiretroviral Pregnancy Registry to monitor fetal outcomes of pregnant women exposed to efavirenz: 1-800-258-4263. Studies in rats have shown that efavirenz is excreted in milk.</p> <p>Efavirenz concentrations were measured in 34 exclusively-breastfed infants whose mothers were on efavirenz-based regimens. All infants achieved concentrations above the published IC50 for wild-type HIV-1 (0.51ng/ml) and the median concentration was 167 x IC50.(Olagunju et al. CROI 2013)</p> |
| <p>Drug Interactions</p> | <p>Efavirenz can either induce or inhibit CYP3A4. Also inhibits 2C9, 2C19. Efavirenz induces UGT1A1. See NNRTI interaction chart</p> |
| <p>Baseline Assessment</p> | <p>Psychiatric assessment (depression, sleep patterns, any CNS disturbances), pregnancy status and adequate contraception in females of childbearing age, CBC/diff, LFTs, examine skin for baseline.</p> |

| | |
|---------------------|---|
| Routine Labs | Psychiatric assessment ,CBC/diff, LFTs q3-6mo. Assess for skin rash and CNS effects every 1-2 weeks when starting therapy for the first 6 weeks. D/C drug: LFTs >5xULN, severe rash or rash with constitutional symptoms (see above under toxicity). |
| Dosage Forms | Capsules: <ul style="list-style-type: none"> • 600 mg (yellow), DIN 02246045 (30 tablets/bottle) • 200 mg (gold), DIN 02239888 (90 capsules/bottle) • 100 mg (white), DIN 02239887 (30 capsules/bottle) • 50 mg (gold and white), DIN 02239886 (30 capsules/bottle) Pediatric Suspension (strawberry-mint flavour) available via Expanded Access (1-877-372-7097). Combination formulations: <ul style="list-style-type: none"> • Atripla®: efavirenz 600 mg/emtricitabine 200 mg/tenofovir 300 mg tablet (DIN 02300699) |
| Storage | Efavirenz capsules and tablets should be stored at 25°C (77°F). Store suspension at room temperature. |
